

AUDIONET USA

Ultra High End Audio Made in Germany

AMP

The Audionet AMP mono block power amplifier combines an excellent sound with first-class technology. Switch on and hear how every sonic detail floats in a transparent space with maximum ease and accuracy. Producing a fascinatingly free sound, the AMP impresses with its audio permeability, and tonal precision, which strikes coarse and fine dynamic precision. AMP's transparent, airy, and colorful reproduction is refreshingly relaxed.

The AMP represents the apex of our internationally respected, prize-winning Ultra Linear Amplifier (ULA) technology. Its complex circuit topology enables you to hear results at the very limit of what is possible. Signal impurities are noticeably absent even under high pressure situations. Its high performance reserves and the unbeatable level of return loss bring out the full potential of even the most challenging loudspeakers.

The precision and power of the ULA technology means that all of the characteristics of components and materials can be heard clearly. That is why we use only the very best components at every sound-critical point. All relevant components are subject to stringent tests and are matched during the manufacturing process. This guarantees optimal performance and safety. The power stage is fitted with six selected and matched power MOSFETs and their distortion is linearly directed in real time with a unique, networked correction circuit. The signal path does not contain any passive or electromechanical components.

A microprocessor with a separate power supply controls all functions and a large display provides clear text information regarding the operating status.
