

AMP III

AMP IV

AMP V

The AMP III, IV, and V are Audionet's three, four, and five-channel power amplifiers designed for music lovers who require more amplification. The products are also functional as compact home cinema amplifiers.

These multi-channel amplifiers combine excellent performance and incomparable sound within extremely compact dimensions. Whether playing Mozart or King Kong, they perform all tasks with dedication, captivating their listeners with an authenticity seldom encountered. Their sound is characterized by speed, purpose and honesty. These lively devices are full of charm, finesse, and attention to detail and are fully committed to delivering a realistic sound experience.

As with all of our mono and stereo power amplifiers, these devices represent a development of our Ultra Linear Amplifier technology concepts. The circuitry is designed for exemplary minimal distortion levels,

speed, and stability. Their construction enables the separate channels to work as independently from each other as possible. Sound damaging influences from the amplifier have been almost entirely eliminated as a result of each high quality hand picked component. This guarantees exemplary reproduction stability.

A high performance processor monitors these amplifiers, ensuring simple operation, stable operating safety, and verification of the phase-correct connection to the mains supply. This can all be activated with a standard remote.

The Audionet AMP III, AMP IV, and AMP V each display compact form and high performance through their state-of-the-art technology.
