

AUDIONET USA

Ultra High End Audio Made in Germany

AMP VII

The AMP VII is Audionet's declaration for home cinema. Packing 7 power amplifiers into a single body, it amounts to 58 kilograms of pure, bundled power. The listener is entranced not only by its sheer power and rock-solid steadiness, but its refined detail and complete audio purity. The breathtakingly realistic sound stage that it constructs makes it the ideal partner for perfect multi-channel music reproduction.

The uncompromising multi-mono power amplifier construction of the AMP VII truly impresses listeners. With every channel working independently with a separate power supply (650 VA transformer and 50,000 uF filtering capacitance), the individual amplifiers are realized in our complex Ultra Linear Amplifier circuit topology. An almost infinite input resistance and a constant input capacitance provides

for an intact input signal. An extremely fast, local corrective stage prevents the development of distortion in real time. Bench tests have registered results that push the boundaries of what is possible. Signal impurities are noticeably absent, even when pushed to the limit. AMP VII's outstanding return loss ensures that the loudspeakers give a clean reproduction in any situation.

Performance is monitored and controlled by a microprocessor, ensuring the individual and successive start and shut down of every amplifier unit. It monitors temperature and DC voltage, providing information via a large, removable display. This means that your components and loudspeakers are protected at all times, even during critical situations.
