

## PRE G2

The PRE G2 plays music at the best possible quality with a mix of the highest definition and absence of tonal discoloring, both coarse and fine dynamic precision, and an uncanny spatial illumination.

All components, including the magnetically buffered pulse encoder, are hand picked from the best selections and built from scratch to ensure the finest quality operational amplifier. Volume is set with a unique electronically switched precision resistance network with real time linearization. Signal transmitting and controlling functions are optically decoupled. The input circuit and output driver are immune to negative influences from other connected devices. The results make the PRE G2 a bench test leader. Noise, distortion, and crosstalk are practically eliminated.

Control is provided by a high-performance microcontroller with its own power supply. All information is set out on a large display and functions can be controlled by remote.
